Part 1

Part 2

Part 1

Introduction

- This is a test
 - · of the Docker container

A slide with a citation

Greenland and Pearl (2011) define collapsibility as
 When an adjustment does not alter a measure, the measure is said to be collapsible over C or invariant with respect to the adjustment. Conversely, if an adjustment alters a measure, the measure is said to be non-collapsible over C.

4

A slide with some maths

- Neuhaus and Jewell (1993) explained that where f(p) is the link function
 - GLMs: $f(\mathbb{E}[Y]) = \eta$
 - e.g. logit link; $\log\left(\frac{p}{1-p}\right) = \eta$
- v is the conditional association between X and Y (on the scale of the linear predictor)
- Characteristic collapsibility function (CCF) $g_v(p)$, named by Daniel et al. (2020), maps P(Y|X=0,C) to P(Y|X=1,C) (e.g. part (b) of first figure)

CCF:
$$g_v(p) = f^{-1} \{ f(p) + v \}$$

• Take away: A parameter is said to be non-collapsible when its CCF is non-linear

5

Part 2

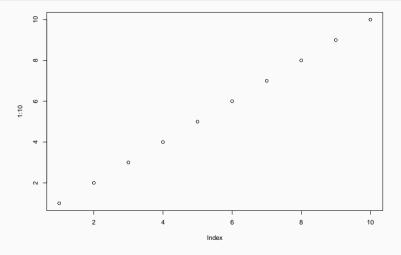

A slide with some code and output

· Estimate the marginal odds ratio

A nice kable table

	2.5 %	97.5 %
0.667	0.379	1.17
2.250	1.011	5.01
		0.667 0.379

A slide with a plot
